

ROADWAY WARNING SYSTEMS

As the volume of traffic increases on our roads and highways, so does the risk of accidents. Many of these accidents are the result of excessive speed unsafe for road conditions. A Cardinal high-speed in-motion vehicle scale placed upstream from a hazardous section of road, bridge, or rail crossing can selectively warn vehicles of the danger based on their speed and weight. If the vehicle's speed exceeds a preset limit for its classification type and weight, a roadside variable message sign will turn on warning the driver to decrease their speed.

One of several programmable messages can be used so that the message is appropriate for the condition. The vehicle speed can even be shown as part of the message.

Cardinal offers a full line of static and in-motion vehicle scales, counters / classifiers and engineering services as well as prompt on-site service.

Variable message sign with warning.
